

Transactions

Learn how to check and process card transactions with DECTA API

After the authorisation has been approved and is captured, the authorisation is closed and a Transaction object is created. DECTA API transactions functionality provides the possibility to get information on cleared transactions and your posted card account transactions.

Check a card transaction

To receive a list of card transactions for a selected card, use the `GET /v1/api/cards/{ppan}/transactions` request. To limit the list, you can choose several filter parameters, like count or ID number and others.

Process card transaction

If you want to make card top-up or withdrawal from the card, you should use the `POST /v1/api/cards/{ppan}/transactions` request. If the `WITHDRAWAL` transaction type is specified, then the card account open-to-buy balance will be checked before executing the request and in case the balance is insufficient, the request will be rejected; if the `FORCE_WITHDRAWAL` transaction type is specified, the request will be executed without checking the card account open-to-buy balance.
