

Native host-to-host interface

The Native host-to-host interface, based on ISO 8583, serves as the integration solution for data processing between DECTA and its partnering White Label or Third-Party Provider (TPP) customers. This is an optional integration and is available according to agreement.

This interface offers a comprehensive solution for issuing Customers, allowing them to autonomously approve or decline authorisations, manage card account balances, validate limits, configure fraud rules, and oversee fees and commissions.
